## **IN THE ABSTRACT**:

A solid electrolytic capacitor [[(1)]] comprises a capacitor element [[(2)]] which includes an anode foil [[(4)]] and a cathode foil [[(5)]] rolled with a separator [[(6)]] interposed therebetween, and a solid electrolyte layer or an electrically conductive polymer layer provided therein. The cathode foil [[(5)]] is coated with a film of a metal nitride or a non-valve metal. The cathode foil [[(5)]] has a smaller width than the anode foil [[(4)]], and the anode foil [[(4)]] has substantially the same width as the separator [[(6)]].
